Abstract

The paper is focused on the development and experimental verification of scientific-pedagogical maintenance of medical college students’ tolerant thinking and activity development. As leading methods the following ones have been chosen: express questionnaire “Index of tolerance”; the technique for diagnostics of predisposition of the individual to conflict behavior by K. Thomas; the technique of diagnostics of general communicative tolerance, which was used to diagnose the level of communicative component’s formation. The article offers modifying variant of psychological education content at the medical College of tolerant orientation; presents the model of educational process on psychology, aimed at medical students’ tolerant style of thinking and activities developing, including: a) transformation of traditional contents and forms in teaching psychological disciplines for medical students and methods of their activities; b) main stages and directions of college teacher’s activity, developing students’ tolerance in the process of their psychological education. The experiment conducted in the framework of the research gives grounds to make a conclusion about the effectiveness of scientific-pedagogical maintenance of medical college students’ tolerant thinking and activity development.

Scientific-Pedagogical Maintenance, Medical College Students, Tolerant Thinking, Development.

1. Introduction

1.1. The relevance of the study

In recent years, vocational school pays special attention to the educational process’s efficiency and quality improving, but forgetting sometimes about the formation of common humanitarian orientation of the individual and one of its aspects such as tolerance that determines this quality. It should be noted that within the framework of humanistic outlook formation in recent decades, the theme of tolerance has become one of the most urgent and widely sought after in the educational systems of all developed countries.

The attempts to give a scientific definition of tolerance arises considerable difficulties since it is used in various fields of knowledge: ethics, psychology, pedagogy, politics, theology, philosophy, medicine, and others.

Focusing the multifaceted problems in the selected content field, it is appropriate to consider the tolerance as a multi-component quality of the individual, presupposing its ability to adapt to a complex and ambiguous environment of modern professional society, organically integrate into it, to perceive its variability as a "normal development", to be able to see the diversity of the surrounding world, combining his own vision to the assessments and approaches of other individuals [1].

In this regard, it is possible to call the meaningful socially significant qualities of thinking’s tolerant strategies and individual’s activities.

1.2. Literature Review

Modern problems of tolerance studying are diverse: tolerance in the process of gaining by the personality of its integrity [2], the problems of inter-ethnic tolerance [3] [4] [5], the limits of tolerance [6], tolerance in the educational system [7] [8] [9] [10], tolerance as a value of socio-cultural system [11] [12] [13] [14] [15], tolerance as a behavioral reference point [16] [17] [2] [18], and many others. However, it should be recognized that the idea of tolerance today, is insufficiently developed in the education, particularly, in Russian: without attention for a long time remained the development issues of tolerance directly in the learning process, including in institutions of secondary vocational education. Today, it is virtually obvious for all that the realization of the idea of tolerant style of thinking and activity is associated with today's social order of students’ preparation for future professional activity. Therefore there is a need to study this problem, determine its scientific status, scientific study and search of ways to develop tolerance in the learning process [19] [20] [21].

The relevance of future medical workers’ tolerance formation is due to the nature of their chosen profession, in which very clearly the humanistic orientation is manifested, suggesting the availability of such qualities as being kind-hearted, having sincere attitude to the patient, being able to understand his abnormal physical and mental states, expression of sympathy, complicity and the participation in patients’ problems, possessing of a high degree of tolerance for negativity in communication and behavior and a number of other qualities.

However, the analysis of practice shows that the discussed personal qualities’ formed level of vocational colleges’ graduates’ is very low.

2. Materials and Methods

2.1. Methods of study

During the study the following methods were used: analysis of pedagogical, psychological, scientific-methodical literature on the research problem; SWOT analysis; comparative analysis of educational and curricula documentation on the psychology; study and generalization of pedagogical experience; pedagogical experiment; observation; questionnaire; interview; testing; expert evaluation method; methods of statistical processing of experimental results.

2.2. Methodic of study

As basic techniques the following ones have been selected:
- express questionnaire "Tolerance index" [5] [22]. Three subscales of the questionnaire are directed to diagnose issues such as ethnic tolerance, social tolerance, tolerance as a personality trait;

- method of diagnosing a predispositions of a personality to conflict behavior by K. Thomas (adaptation N.V. Grishina) [23].

- a method of diagnosis of common communicative tolerance [24], which is used to diagnose the level of formation of the communicative component of tolerance.

3. Results and Discussions

3.1. A retrospective analysis of the tolerant style of thinking and activity

The analysis of the literature and regulatory documents allowed us to make a confident conclusion that the problem of formation of tolerance was not artificially embedded in the educational space – it followed, for example, from the analysis of the state educational standards of vocational training (table 1).

</tbody>
</table>

The analysis of the SES VT shows that tolerant strategy thinking and behavior are inherent to those professional qualities that are indicated among the priorities of professional of medical profile in the regulations, and sometimes inevitably are included as components.
This allocates the importance of the problem and the need for appropriate transformation of the content and students’ methods of active learning in medical colleges.

The validity of necessity of tolerantly oriented transformations of psychological education’s traditional system at medical College can be explained by the SWOT-analysis of psychological education’s content.

Table 2. SWOT-analysis of traditional and transformed in the context of the tolerance-based psychological education in medical college

</tbody>
</table>

The long term benefit of medical students who have mastered the transformed course of psychology in the key of tolerance:

- The ability to vary the style of interaction, depending on the condition and personality characteristics of the interlocutor;

- The ability to build communication in the team on tolerant behavior and activities’ strategies (cooperation, compromise);

- Ability to establish and maintain collective favorable psychological atmosphere;

- Willingness to provide personally-oriented psychological care and support to patients and their relatives;

- The ability to build business communication based on the productive combination of their own business, professional interests with the interests of the partners;

- Regulation of their internal state, rapid recovery of mental equilibrium by using a specific set of

Possible risks from the lack of transformation of psychology course in the medical College:

- Callous attitude of nurses to patients, without regard to their individual personality characteristics and physiological state;

- Use of unproductive communication strategies, the pursuit of only their own interests in personal and professional conflict;

- The lack of nurses’ skills of individual approach in the provision of psychological assistance to patients and their relatives;

- The inability of nurses to engage in constructive dialogue, authoritarian style of management, the resolution of the contradictions, problems and controversies "by force".
psychological techniques for the implementation of productive communication.

In the context of the theme the analysis is done on the problem under study research, which reveals that in the formation of tolerance a dominant emphasis is done on ethnic and cultural behavioral component, but obviously is not used enough the potential in the content of education (in particular, psychological) and in organization methods of students’ educational activity. From this analysis promising directions are identified that should be taken as a basis in further research of the designated problem of vocational medical education:

- illustration how intolerant attitude to a number of possible mutually supplementary approaches to the description of some phenomenon, object or process as obviously unproductive really leads to some negative consequences;

- illustration how intolerant neglect of a number of parties, properties, aspects and features of a holistic pedagogical phenomenon lead to the impossibility of a productive solution to the challenges that society poses to the system of vocational education;

- illustration how the rejection of the opponent's point of view in the debate, discussion as clearly invalid, in most cases does not lead to positive results.

3.2. Substantive and procedural aspects of a tolerant style of thinking and activity development among medical students in the process of psychological education

The analysis is performed and the levels are revealed of tolerance ideas’ implementation in the traditional psychology course content.

Representation of tolerance in the key dialectical (dialectic – a type of epistemological tolerance), involving the illustration of the unproductive approach based on dichotomies (either / or) – as opposed to "dialectical complementarity"

Reasonable (in some cases compromise) connection, the combination of seemingly opposite approaches to addressing of the social and professional phenomena, aimed at perception of superficially incompatible positions as "related" one, but addressing of the problem from different sides or from different angles of view.

The author's special course "Tolerance in medical profession" is developed in the study, which is aimed at the development future nurses' skills to manage their behavior in communicating with patients and colleagues, and includes cognitive (awareness of tolerance and professional culture), communicative (improving of communication skills from a position of tolerant interaction and the development of skills of self-regulation in the process of communication and activity) and behavioral (development of tolerant strategies of behavior and activity) components.

In the study traditional methods' transformation of students' educational activities organization is presented (table 4).

| **5. training oriented on tolerance** | Focus on complex formation of tolerant communication style as a holistic multi-component construct. |

A list of the sources to design tasks, fragments of lectures is presented aimed at the tolerant strategies of thought and action development which contain contradictions to be resolved, description of conflicts, ambiguous and controversial situations, etc.:

1. The relevant fragments known to students of literary, artistic and journalistic, scientific and popular works.

2. Relevant fragments of everyday personal and professional experience of the teacher.

3. Relevant information from TV and radio programs, films, theater; Internet resources.

4. Appropriate situation of the everyday life and the educational experience of students, including learning in a particular school, educational group, etc.

5. The relevant professional experience of teachers of specialized disciplines and personal professional experience of students.

Fig. 1 also shows the sequence of actions of the teacher, modifying the content of the psychological education for tolerance formation.
Figure 1. The sequence of teacher’s actions, modifying the content of psychological education with the purpose of tolerant style of thinking and activity development
Summarizing all the above mentioned, a model of educational process on psychological disciplines can be suggested aimed at the development of medical students’ tolerant style of thinking and activities (Fig. 2). In this model the modification of the traditional psychological course’s content and forms of students’ activities organization are reflected, to enhance the effectiveness of the course in terms of forming of tolerance among medical students.

The medical student with the developed tolerant attitudes and strategies

The content of the training focused:
- to illustrate the unproductive use of force, arbitrary methods and approaches in solving problems of science, practice and society in general;
- the productivity of a multipolar, comprehensive analysis of the surrounding phenomena and approaches to their description and also the unproductivity of unilateral, unipolar analysis, inevitably reducing the possibility of obtaining a reliable picture of what is happening;
- on the idea of tolerance in dialectical key.

The activity of the teacher, including:
- the identification of unrealized aspects of tolerance in the content of education;
- design in which lectures and seminars, and at what level a tolerant oriented training material can be used;
- design of tolerant oriented content, forms and methods of work of students, development of appropriate scenarios;
- the implementation of a specific scenario of training sessions;
- analysis and if necessary correction of the selected content, forms and methods of work.

The levels of inclusion of tolerance idea in the content of the training:
- mention, remark, link to, focus on information on the tolerance;
- an example of tolerant and intolerant behavior and thinking, illustrating information on a particular topic;
- small independent fragment of the course of psychology;
- "through" idea underlying the information unit, theme or topic;
- one of the components to be included in the electives, elective courses;
- independent elective, special course;
- inclusion of the phenomenon of tolerance in a list of topics designed for graduate qualification works, independent creative projects.

The inclusion of students in such activities, which involve:
- resolution of contradictions, conscious choice of productive solutions from several alternatives;
- formation of skills to achieve the desired result by intelligent compromise;
- the use of historical and biographical facts and information that illustrate the manifestation of tolerance in specific fragments of scientific knowledge.

</table>
her own opinion, but is sure it is being wrong about them, but intuitively and situational selects forms of tolerant behavior;
- in conflict situations prefers the strategy of "avoidance" or "adaptation".

| Low | - the individual adheres to his or her own ideas and refuses to evaluate critically himself;  
- individual is categorical or conservative in the estimates of people, thus it regulates the expression of individuality of partners and requires to the preferred uniformity that matches his or her inner attitude -prevailing values and norms  
- the individual is not willing to consider the opinions of others;  
- he is kept in isolation;  
- the individual refuses to make concessions in conflict situations.  
- the individual manifests open hostility towards others;  
- in conflict situations the individual prefers to apply the strategy of competition and by any means to achieve his or her goals;  
- the individual considers as justified the preparation and execution of certain actions aimed at the prohibition, restriction of activity or coercion against other people. |

At the beginning of the 2013 academic year, the ascertaining experiment was carried out. Its purpose was to: identify the initial state of students’ tolerance formation in medical College who participated in experimental work. "Input" study was carried out, which was the basis for the search and generating parts of the experiment, as the obvious need for tolerant thinking and activities of the nurses showed their obvious immaturity.

On exploratory (pilot) phase of the experiment the developed methods were applied partially (partially truncated) in order to figure out if they fitted into the educational process in the framework of psychological disciplines, if they adequately perceived by the teachers and students, what obvious correction on the first results of the application was required and what training for participants – teachers was appropriate (instruction, special classes, and training materials).

At the stage of forming experiment in educational process various forms and teaching methods were implemented: business games (operational and role-play, business theatre, psychodrama and socio-drama), discussions, brainstorming, workshops and the method of "case studies". The results received in control and experimental groups and the rates of primary cutoff and final cutoff in each group were compared.

In 2014-2015 according to the results of the forming experiment the final testing using the selected methods was conducted and the following results were obtained. The level of such unproductive from the point of view of tolerance strategies as competition, avoidance and adaptation as a result of experimental effects decreased on 19, 3 and 4%, respectively. The number of respondents who preferred cooperation and compromise (attributable to tolerant) significantly increased respectively by 15% and 11%. In the experimental groups
along with the traditional forms simulation training was used for the purpose of forming tolerance.

There was a significant reduction in the number of respondents with a low level of tolerance (40%), the increase in the number of respondents who diagnosed the average level of communicative tolerance (28%) and especially significant was the growth indicator of a high level of communicative tolerance (12%).

Thus, after simulation training, the students became more tolerant, not only with regard to the opinions, points of view and the positions of others, but also to the perception of people and phenomena of the surrounding world in general. This is particularly important for tested ones – taking into account the specifics of their future professional activity. The use of imitation learning allow to develop students’ general positive attitudes towards the surrounding world, beliefs and values that are essential for interaction with others in the process of the future professional activity.

4. Conclusion

The development of a tolerant style of activity both as socially and professionally valuable qualities of a future medical worker of an average link is possible in the process of psychological education, including general, social and health psychology presented in SES VT of medical direction through the actualization of tolerant capacity of the traditional content and consequential semantic permutations of accents [25] [26] [27].

The development of tolerant way of thinking in the process of psychological education of students of medical college provides orientation of the content on "epistemological prototype of" tolerance, comprising:

a) systematic illustration (as at the level of individual examples, and at the level of generalized ideas) of how in some cases is unproductive the dichotomies approach to the study of the phenomena of the surrounding world and constructive dialectical one, primarily oriented to the principle of subsidiarity;

b) a transition in the content of education from undue one-sidedness of consideration of objects and phenomena to multi-polarity – a finding of similar in different and focus on the complementarity of different approaches to the description and explanation of mechanisms of phenomena and processes’ occurrence;

c) the use in teaching of case studies on the analysis of contradictions, inconsistencies, conflicts and inconsistencies, which is performing and yielding to the result in the logic of "reasonable compromise";

d) application of this variant of simulation training, which includes active participation of students in the resolution of specific professional subjects requiring the implementation of strategies’ selection, the analysis of contradictions and inconsistencies – in the process of trainings, business games, discussions, the method of "brainstorming", etc.

The modeling of tolerant oriented process of medical college students’ psychological education allows combine all the transformations of the educational process into a single semantic key and implement the idea of integrity in the formation of the studied multicomponent personality quality.
